Code review and Comments

1. Introduction

I hope you spend a good day, I want just point out a couple of thing to notice about this article. The first point that I am not intended to judge and discourage someone's job, the very important thing is: I commented out the code without considering circumstance or situations, and free of biased.

2. On progress tasks

- ❖ **Home Screen** – This is the first view screen where students get after they authenticated (if the app requires login and registration functionalities).
 - It have the following stateless widget classes
 - ✓ HomeScreen class- this class is relatively good code structure and nice looking compared to others.
 - ✓ It includes book rating, ReadingListCard, RoundButton and twoSideRoundButton widgets – these 3 widgets are a milestone to build a home screen.
 - It consumes 3-5 days as a part time job depending on how good coder he/she is.
- ❖ **Detail Screen** – I am not pretty much sure what this screen does, but I guess, this screen allows the student to choose course content of the selected book.
 - It includes one beautiful asset (image). Since I am not sure whether the image created by the developer or downloaded from internet, I am not considered this asset for time estimation.
 - It takes 2-3 days to implement the design.
- ❖ **Other Screens**
 - Course list
 - Route generators – allows to navigate from one screen to other screen
 - Project setup – manage main method routes and other constants
 - It might take 1 day

Sincerely yours!
